Problem-Solution Fit: Laptop Request Catalog Item

Step	Section	Detail for Laptop Request Catalog Item Project
1	Requirement Gathering	Identify all required variables (e.g., Laptop Model, Department, Justification) and the rules for their collection. Define the necessary dynamic behavior (e.g., justification required for high-cost items) and map the required approval flow.
2	Plan Development	Create the Service Catalog development roadmap: Create Update Set $\rightarrow$ Service Catalog Item creation $\rightarrow$ Add Variables $\rightarrow$ Create Catalog UI Policies

		\$\rightarrow\$ Create UI Action (for reset) \$\rightarrow\$ Testing \$\rightarrow\$ Export Update Set.
3	System Analysis	Audit the user profile data to ensure Manager and Department fields are consistently populated for use in pre-filling and automated approval routing. Analyze the existing list of approved laptop models and their costs to define the dynamic logic for UI Policies.
4	Rule Implementation	Implement Catalog UI Policies to enforce dynamic field behavior (e.g., making accessories visible only when a laptop model is chosen). Implement the "Reset Form" UI Action (button) functionality to improve user experience and reduce abandoned requests.
5	Testing & Validation	Perform Unit and Integration Testing on the Service Catalog item. Validate that all UI Policies function correctly (fields appear/disappear as intended). Confirm the

		Reset Form UI Action clears all variables accurately. Test the end-to-end fulfillment process.
6	Monitoring & Feedback	Track key performance metrics post-deployment, such as time-to-submission , form abandonment rate , and fulfillment team feedback. Use system logs to monitor for unexpected errors in the dynamic logic and refine the solution based on usage data.
