### Project Design Phase: Proposed Solution

**Project Name:** Laptop Request Catalog Item

| S.No. | Parameter                                   | Description                                                                                                                                                                                                        |
|-------|---------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1.    | Problem Statement<br>(Problem to be solved) | The current process for requesting a laptop is manual, resulting in significant delays and a high chance of inaccurate data collection. This is due to the lack of dynamic form guidance and automated validation. |
| 2.    | Idea / Solution description                 | A <b>Service Catalog Item</b> will be created. This item will feature dynamic fields controlled by <b>Catalog UI Policies</b> (e.g., showing/hiding fields                                                         |

|    |                                              |                                                                                                                                                                                                                                                                                                                                                              |
|----|----------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|    |                                              | based on selections) and a custom <b>UI Action</b> to easily reset the form. All configuration changes will be captured in an <b>Update Set</b> for governed deployment.                                                                                                                                                                                     |
| 3. | <b>Novelty / Uniqueness</b>                  | The solution focuses on maximizing <b>user experience (UX)</b> and <b>data governance</b> . Uniqueness is achieved through the custom " <b>Reset Form</b> " <b>UI Action</b> (addressing user frustration over input error) and sophisticated <b>UI Policies</b> to enforce role-based compliance (e.g., requiring justification only for high-cost models). |
| 4. | <b>Social Impact / Customer Satisfaction</b> | The solution provides a quick, guided, and efficient self-service experience, reducing employee frustration and time-to-productivity (Gain). IT support teams benefit from receiving complete, validated data, reducing manual follow-ups (Pain).                                                                                                            |
| 5. | <b>Business Model (Revenue Model)</b>        | Not applicable as an internal IT process. The value is measured in cost avoidance, by increasing the efficiency of the                                                                                                                                                                                                                                       |

|    |                             |                                                                                                                                                                                                                                                                                         |
|----|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|    |                             | Fulfillment Team, reducing operational miscommunication, and achieving cost-effective ITSM operations.                                                                                                                                                                                  |
| 6. | Scalability of the Solution | The underlying technical model (Service Catalog Item $\rightarrow$ Variables $\rightarrow$ UI Policies $\rightarrow$ Update Set) is highly scalable and reusable. This structure can be quickly adapted to automate any other equipment or software request within the Service Catalog. |
