Data Flow Diagram (DFD): Laptop Request Process

The Data Flow Diagram illustrates how the employee's request data is processed, validated, and transferred through the Service Catalog system to initiate the fulfillment process.

Component	Description of Data Flow
Employee (Requestor)	Initiates the request by navigating to the Service Catalog Item . Sends form input data (Laptop Model, Justification, etc.) to the System.
Service Catalog Item (Form)	Receives input data. Passes data through Catalog Client Scripts for auto-population (Manager, Department) and through UI Policies for dynamic validation and display logic.
ServiceNow System (RITM)	Receives validated data from the form. Creates a Request (REQ) and a Request Item (RITM) record. Maps all form Variables

	to the RITM for storage.
Workflow / Flow Designer	Receives the RITM record. Reads the variables (e.g., Laptop Model) and initiates the fulfillment process by creating specific Catalog Tasks for the Fulfillment Team (e.g., Procurement Task, Imaging Task).
Fulfillment Team	Receives the Catalog Tasks and RITM data. Updates task status (e.g., 'Closed Complete'). This status flows back to the RITM and finally to the Employee via notification.

User Stories

User Stories define what different stakeholders need from the system to ensure all functionality, including dynamic behavior and UX features, is implemented successfully.

User Type	Functional Requirement (Epic)	User Story / Task	Acceptance Criteria	Priority	Release
Employee	Core Request Submission	As an Employee, I want to submit a request for a laptop with all mandatory fields completed.	The form must prevent submission if mandatory fields are empty, and must successfully create a	High	Sprint-1

			Request (REQ) and RITM upon success.		
System	Data Accuracy (UI Policy)	As a System, I must enforce that the Justification field becomes mandatory when a High-Spec Laptop model is selected.	The Justification field must be visible and mandatory <i>only</i> when the 'High-Spec Laptop' value is chosen, and hidden/non-mandatory otherwise.	High	Sprint-1
Employee	User Experience (UI Action)	As an Employee, I want to click a "Reset Form" button to quickly clear all previously entered data.	Clicking the button must execute the custom UI Action to clear all variables to their default state without navigating away or submitting the form.	High	Sprint-2

Fulfillment Team	Fulfillment Readiness	As the Fulfillment Team, I want all submitted Variables to be clearly visible on the RITM record to process the order correctly.	All form variables must be accurately mapped to the RITM record and displayed on the form.	High	Sprint-2
System	Governance	As an Administrator, I want all configuration changes to be captured in a single, dedicated Update Set for deployment.	All newly created/modified records (Item, Variables, UI Policies, UI Action, Client Scripts) must be present in the designated Update Set.	High	Sprint-2
