

Laptop Request Catalog Item

Brainstorm & Idea Prioritization Content

1. Define your problem statement ²

Frame your problem as a "How Might We" statement³. This will be the focus of your brainstorm⁴.

Category	Content
How might we (your problem statement)?	How might we streamline the laptop request process to ensure quick fulfillment and accurate data capture, eliminating the need for manual follow-ups?
Key Rules of Brainstorming	* Stay in topic. [cite: 37] * Encourage wild ideas. [cite: 39] * Defer judgment. [cite: 40] * Listen to others. * Go for volume. * If possible, be visual. [cite: 42]

2. Before you collaborate (Preparation) ⁵

A little bit of preparation goes a long way with this session⁶.

Step	Detail for Laptop Request Project
Team gathering [cite: 28]	Identify key stakeholders: Service Catalog Developer (You), IT Fulfillment Team Lead, and a HR/End-User Representative. Share

	the project goal and the current manual process pain points as pre-work. [cite: 29]
Set the goal [cite: 30]	Focus on solving the issue of dynamic data collection and improving the user experience (UX) of the laptop request form. [cite: 31]
Learn how to use the facilitation tools [cite: 33]	N/A (For a physical/Mural session; assume internal collaboration tools are in place). [cite: 34]

3. Step-2: Brainstorm, Idea Listing, and Grouping ⁷

Prompt: Brainstorm ideas that address the "How Might We" statement. ⁸

Category	Idea Notes (Examples)
User Experience (UX)	* HMW provide a single, clean 'Request' button visible only after mandatory fields are complete? * HMW use an accordion view to manage the number of fields so users don't get overwhelmed?
Data Accuracy/Variables	* HMW dynamically change the available laptop models based on the selected "Job Role" (e.g., Engineer gets high-spec, Admin gets standard)? * HMW automatically populate the user's "Department" field based on their profile data?
Process Efficiency	* HMW include a prominent "Need Help?"

	link that connects to IT support? * HMW add a "Reset Form" UI Action that clears all variables back to default if the user makes a mistake?
Fulfillment	* HMW pass the correct required accessories (e.g., docking station) to the fulfillment task based on the laptop model selected?
Governance	* HMW ensure all changes (variables, UI Policies) are captured in a single, dedicated Update Set for easy deployment?

4. Step-3: Idea Prioritization ⁹

Your team should all be on the same page about what's important moving forward¹⁰. Place your ideas on a grid (Importance vs. Feasibility) to determine which ideas are important and which are feasible¹¹.

Idea Example	Importance (High/Low)	Feasibility (High/Low)	Rationale
Dynamically change model list based on Job Role.	High	Medium	Crucial for data accuracy and budget control. Requires advanced Catalog UI Policy/Script.
Add "Reset Form" UI Action.	Medium	High	Good for UX and prevents abandoned forms.

			Simple to build with a UI Action and Client Script. (Quick Win)
Automatically populate Department field.	High	High	Eliminates user error; standard functionality using a simple Client Script. (Quick Win)
Use an accordion view for fields.	Medium	Medium	Improves UX but adds complexity to the form layout and maintenance.

Would you like to move on to the next development step, such as **defining the variables** for your Service Catalog Item?
